It wasn't very long ago when we built the images we wanted to create in offline photo editors. Photoshop, Lightroom, and other tools have transformed the way we edit digital photos. Their initial

success led to greater adoption of the desktop app model. Over the course of its history, Photoshop has always had a place on devices. So for many, the use of a desktop app much be considered a luxury. In recent years, however, Adobe has brought desktop app capabilities to the web that bring this large set of capabilities to the web. Among its many new tools, Photoshop has enabled us to edit our photos and create new art in a browser. It's as if Photoshop in the browser marks the culmination of desktop-app-like capabilities on the web. When the browser first gained ground, the idea of running software as complex as Photoshop directly in the browser would have been hard to imagine. However, by using various new web technologies, Adobe has now brought a public beta of Photoshop to the web. With the new web developer tools like Chrome DevTools, web applications can become powerful tools for experiments. While tools like Photoshop are already becoming more easy to use on the web, many are still unaware of the new capabilities that become accessible. Obviously, the accessibility of these tools matters much more when web-only tools are expected to be as powerful as the native app. Photoshop takes on a new normal where certain tasks are expected. By offering a browser-based editor means that these tasks too are expected. For example, tasks like batch uploads, web-based live previews, and other users can be toggled on and off. If a graphic designer wants to collaborate on a project, that too can be enabled or disabled. While Desktop-like tools are an expected offering at this point, it would be foolish not to recognize how the web is becoming a new way for creativity to flourish. 933d7f57e6

In the native native GPU APIs, the digital canvas will function as a surface from which lights are applied and textures are overlaid, against which 3D models are viewed, and physical camera or lens effects are added, before being exported to another format of choice. Initially, 3D motion will be removed to utilize the new 2D GPU APIs for added stability across platforms and to support more functionality. We will be iterating and refining the native GPU options in development so that the Digital Canvas can be the foundation of modern 3D workflows across all applications. Once stable, we will expand the ecosystem of native GPU effects to integrate with Photoshop and the Substance products, including material setters, cloud clipping, and Layers. This has long been a characteristic of adobe photoshop and has often resulted in confusion for users unfamiliar with the new format of the operating system. This is an example of being usable for

users, but in some ways, making it harder for developers or photographers in other platforms. Adobe phas promised to update the action builder for windows in 2017, but it never happened.

For working on interactive and dynamic assets, such as video-game props or animated characters, there will be a much more limited scope for developers to make changes. This transition will be made possible by exciting new developments by Adobe and across the industry, such as native GPU-accelerated 3D

APIs built on Metal and WebGPU. Things are about to get interesting in the World of Creative Technology. Stay tuned!
