It involves an actual grasshopper, which is brought to life through the power of some clever projection, sound and lighting. But it's not magic, it's science, and it's a film called The Rise of the Grasshopper, which was made by a student at the college in which I teach. If you find yourself asking "how did this actually come to be?", then you may be part of the group of people who hasn't seen the original short film. The Rise of the Grasshopper has only been seen about 200 times since it debuted in the short film festival circuit back in May. But the online effort of raising money to go into production is a real testament to the internet. If you haven't yet, then do so at the link on the top right of this page, or at The timing is right to finally release the movie. The National Geographic TV channel has already aired a short segment of the film, and is now in the process of buying the rights to the story. In the short film, the grasshopper learns through natural selection that it is a grasshopper, but it's no longer aware of the ability to fly. That is changed in the final scene. I'm so impressed by what

What's New In ShaderMark?

ShaderMark is the first and only pixel shader / shader model 3.0 benchmark. The program was born to fulfill the need of a native, untouched HLSL pixel shader benchmark in the VGA industry. This means that ShaderMark is not a software developed for marketing or promotion purposes, it's pure and simple. With ShaderMark, you are able to run benchmarks up to shader model 3.0 in a native environment with a Microsoft HLSL reference rasterizer. ShaderMark is also the first and only program capable to benchmark the shader performance, quality and features from the new windowing system (desktop, windowed modes). With the help of the 'Picture Quality Mode', you can choose between 'High Quality', 'Medium Quality' or 'Low Quality' and analyze the results. There is also support for a maximum of three shaders and a maximum resolution of 4K (3840 x 2160). The GPUBenchmark benchmark is supported as well, with the aim to provide a reliable information and measures of the overall graphic power of your PC. Both benchmarks are provided in less than 1GB of space, with ShaderMark coming to around 1GB and GPUBenchmark at around 1.1GB. While you are able to change the rendering mode from OSD to manual, the benchmarks use in-game controls. This allows you to improve and maintain your system by checking the impact of possible settings (e.g. resolution, shader model, etc) on the benchmarks, as well as letting you compare and spot your GPU performance in details. These reviews, together with the latest benchmark and hardware figures in the form of a simple summary, are available from inside the game. When you compare to the standard benchmarks, ShaderMark is a powerful tool for gaming enthusiasts. What's New In this version, ShaderMark 1.0 comes in a single package and includes a user friendly and intuitive interface. The interface has been completely redesigned and it now includes three sections: 'Data', where you can select and set the rendering mode, windowed or fullscreen, the resolution, shader model, texture and color buffers format, present interval, depth and stencil buffer format, depth and stencil buffers and a special field to check out the graphics quality. 'Settings', where you can set the benchmark parameters, including the frame rate, monitor refresh rate, change from displaying the results in text to displaying them on the screen, and all other options. 'Results', where you can compare the results and their details of
